Toddito Product Roadmap: The Seven Modules — What's Built, What's Next

A product brief — what we'd actually build, for whom, and in what order. Companion to the venture-thesis PDF already shared; this document answers “OK, concretely, what are we building” instead of “why does this matter.”

The Core Idea: One Proven Engine, Seven Possible Products

Toddito already has one thing fully proven, live, and working today: a person has a guided voice conversation, and the product turns that conversation into a genuinely good, human-quality diagnostic report. That combination — real conversation in, trustworthy report out — is the engine. Everything below is the question of **where else that same engine should point**, not a plan to build seven separate products from scratch.

Todd's own framework, developed over decades of consulting practice, already names seven distinct products this engine could support. **One is built. Six are real, well-defined ideas — not vague future possibilities, but specific, describable products Todd has already thought through** — waiting to be pointed at the same engine.

Where the Engine Should Go Next: What the Research Found

Before the module-by-module breakdown, one finding from this week's research is worth stating plainly, because it changes how you should read “not started” below: **not started does not mean “no work has been done.”**

Looking back across every earlier attempt at this kind of product — three prior prototypes the operator built before Toddito, plus the 1987 predecessor — a clear pattern emerged. Every attempt is really trying to understand people at one of four levels: **a single person, the relationship between two specific people, a team or group, or a whole organization.** Toddito, today, is excellent at the last one — whole

organizations. But here's the finding: **the other three levels have already been thought through and partly built, more than once, by earlier attempts — they just never got wired into an engine that actually works.** The earlier prototypes solved the hard-sounding parts (capturing a real conversation, writing genuinely good instructions for how to interpret it) and then stalled at the very last step — turning it into a real finished output. Toddito is the first version that solved that last step.

The single most striking piece of evidence for this: one of the earlier prototypes had already built — and later deleted — a feature description for understanding a **team or community's shared culture**, and the internal description of that (now-deleted) feature reads almost exactly like the guiding question behind all of this work. It was written before this week's research began, by an earlier version of the same effort, and then removed. That's not a coincidence to gloss over — it's a sign the team-level product below is closer to already-defined than “not started” usually implies.

The Seven Modules

1. ORGANIZATION DIAGNOSTIC — BUILT, LIVE TODAY

What it is: A consultant or leader has a ~40-minute guided voice conversation about how their organization actually works. Toddito turns that into a report: where the organization stands, what's working, where the real friction is, and what that friction typically costs.

Who it's for: Independent consultants and boutique consulting firms, today; a PE/M&A due-diligence audience is a validated second market (see module 5).

Current experience: Live at getyourpulse.io. A respondent has the voice conversation; the consultant gets a shareable report designed to read like something a skilled human consultant wrote, not a generic AI summary. Group/multi-respondent versions exist too — several people from the same organization each do the conversation, and the reports combine into one organizational read.

Status: Real, shipped, in active alpha use. This is the one module where “what would the experience be” isn't a question — it already exists.

2. EXECUTIVE COMMUNICATOR — NOT STARTED — BUT THE MOST BUILD-READY OF THE SIX

What it is: Aligns an executive team by surfacing where each executive's read of the company's strategy and operations actually diverges from the others' — not just “is everyone happy,” but “does the CFO and the Head of Product actually agree on what the company's growth engine even is right now.”

Who it's for: Leadership teams who think they're aligned and haven't tested it.

What the experience would look like: Each executive does their own version of the core diagnostic conversation. Instead of reporting on each person separately, the product would synthesize *across* their answers — naming the specific gaps between what different leaders believe, in the same clear, human-readable style Toddito's reports already have.

Why this is the most build-ready of the six unbuilt modules: Toddito already has the multi-person aggregation mechanism this needs (it's how the current group/organization reports work). What's genuinely missing is a synthesis step that speaks in terms of *team alignment* rather than *organizational health* — and this week's research found that an earlier prototype already wrote a real, detailed description of exactly this kind of team-level synthesis (the “team culture” feature mentioned above, before it was removed). That existing language is a real head start, not a from-scratch design problem.

3. CONSULTING COMMUNICATOR — NOT STARTED — BLOCKED ON TODD

What it is: A 16-question self-assessment for consultants themselves — not about their client's organization, but about how well *they*, the consultant, are running the engagement. Todd's own description of this idea: “I've never seen anything like that ever” — it's the module he's personally most excited about.

Who it's for: The consultants who use module 1, turned inward on their own practice.

What the experience would look like: Not yet specified in enough detail to describe — Todd has the full design in his head but hasn't yet handed over the complete specification.

Status: Blocked, not just unbuilt. This needs Todd's actual 16 questions and his framework before any real design work can start — building ahead of that would mean guessing at his own idea.

One real, unconfirmed lead worth following up: the 1987 predecessor system had a separate feature specifically for assessing trust and credibility between a consultant and their client — a different, older version of a very similar idea. Worth asking Todd directly whether this is the same concept he has in mind, or something distinct — it could mean this module has more of a running start than “blocked” suggests.

4. MERGER & ACQUISITION MANAGER — NOT STARTED

What it is: Surfaces cultural and structural fit between two organizations *before* a merger or acquisition goes further — using the same diagnostic lens as module 1, but pointed at two organizations being compared to each other instead of one organization being understood on its own.

Who it's for: Companies or advisors evaluating a potential merger or acquisition.

What the experience would look like: Run the core diagnostic conversation on both organizations (largely module 1's existing mechanism), then add a comparison layer — where do these two organizations' cultures and structures actually clash, and where do they fit.

Why this is closer to buildable than it might sound: it mostly reuses module 1's existing engine twice, plus a new comparison step — not a separate product built from nothing.

5. INVESTOR INSIGHT APPLICATION — NOT STARTED — HAS A VALIDATED DEMAND SIGNAL

What it is: The same organizational-health lens as module 1, framed as a due-diligence tool: before an investor commits capital to a company, get an honest read on the health of the organization they're investing in, not just its financials.

Who it's for: PE and M&A investors evaluating a company pre- investment.

What the experience would look like: Very close to module 1's existing flow, reframed for a different audience and report format (investor-facing rather than consultant-facing).

Why this one is worth prioritizing among the unbuilt six: this isn't a hypothetical market — it's already been identified, independently, as a real go-to-market angle for Toddito ("if you're going to put money into a company, you wouldn't want to put everything in without ensuring its success"). The module and the market thesis point at each other.

6. CLIENT SERVICE PLANNER — NOT STARTED

What it is: Helps an organization become more market-driven and customer-focused in how it actually operates, based on Todd's framework.

Status: Real, but the least fleshed-out of the seven in the material gathered so far — this document doesn't have enough detail yet to describe what the actual user experience would look like. Flagged honestly rather than guessed at: this one needs more direct input from Todd before it can be scoped the way modules 2, 4, and 5 have been above.

7. CONTINGENCY PLANNER — NOT STARTED

What it is: Shifts the question from "tell me what's happening" to "tell me what you think *should* be happening" — a forward-looking, scenario-planning companion to the diagnostic modules, which are backward- and present-looking by design.

Status: Same honest flag as module 6 — real idea, least detail available right now, needs more direct input from Todd to scope concretely.

Two More Product Gaps the Research Found — Not in Todd's Original Seven

Beyond Todd's seven modules, this week's research across every earlier prototype surfaced two more real, specific product opportunities that aren't part of his original framework, but came up independently, more than once, across different attempts:

A personal takeaway layer. After someone does the core diagnostic conversation, today they get an organizational report. What’s never been built: a short, personal reflection for *that individual* — what does this mean for them specifically, not just for the organization as a whole. An earlier prototype had already written real, detailed instructions for exactly this kind of personal reflection step — that writing still exists and could be reused rather than redesigned from scratch.

A “relationship between two specific people” layer. Every module above looks at one organization, or one person, or two organizations being compared. None of them ask: what’s actually true about the working relationship between *this specific person and that specific person* — where do they complement each other, where’s the friction. This exact idea shows up, independently, in three separate places across the research: an early working mechanism in one prototype, detailed instructional writing in another, and the 1987 predecessor’s own separate consultant-trust module. Three independent attempts at the same idea, never shipped as a real feature — worth naming clearly as its own gap, not folded into module 3 above without Todd’s confirmation that they’re the same thing.

What This Roadmap Doesn’t Decide

This is a map of what’s built and what’s real and buildable — not a committed sequence or timeline. A few things still need direct input before any of the unbuilt modules move forward: Todd’s full specification for modules 3, 6, and 7 specifically; a decision from the operator on which of the six unbuilt modules to prioritize; and — this applies to every module on this page that isn’t already live — Toddito’s own team has an open item from a prior review, still unresolved, about the privacy and terms-of-service coverage for the voice data at the center of all of this. That item should close, or be squarely understood, before any of these new modules significantly expand how much personal data the product collects.

This document is the product-focused counterpart to the venture-thesis PDF already shared, and draws on the full Koherent V1/V2/V3 lineage research (docs/BSHR_koherent-lineage-synthesis.md), the engineering plan’s honest built/not-built accounting (docs/PLAN_toddito-engineering.md), and the 1987 system’s module breakdown (docs/PLAN_toddito-1987-venture.md). Read those directly for full technical and historical detail.
